ABSTRACT

A summer program aimed at mastery of instructional objectives in reading and mathematics was provided for 110 deaf children (5-14 years old), many of whom were from non-English speaking or bilingual homes. Participants were administered, as a pretest, selected criterion-referenced tests from the Santa Clara Inventory of Developmental Tasks (Reading) and the BASE (Math) Systems to ascertain individual instructional objectives for each student. Findings showed that learning was nearly universal, with many profoundly handicapped children mastering an impressive number of instructional objectives; that the summer program was not a reiteration of previously mastered curriculum; and that there were no major departures from the program design. (Provided are tables with statistical data and sample information forms.) (SBH)

SUMMER PROGRAM FOR DEAF CHILDREN

Chapter I. PROGRAM DESCRIPTION

The program is designed to provide for the education of 110 deaf children many who entered school late. The participants in this program are profoundly deaf from ages 5 to 14. A major portion of these children come from non-English speaking or bilingual homes and need additional assistance in communication skills development. Participants are regarded as educationally disadvantaged in view of their late entrance to school.

The summer program operated for 28 days, four hours each day at the School for the Deaf, JHS-47M. A teacher-in-charge, assisted by a general assistant organized the program, planned orientation sessions and supervised all aspects of the program, employing a staff of 18 teachers, three school aides, three educational assistants and one school secretary. Classes were organized to provide: development of communication skills; learning English as a second language; lip reading; basic language arts; health and physical education development, cultural enrichment; arts and crafts activities relating to reading and mathematics skills development.

Chapter II. EVALUATIVE PROCEDURES

General Program Objective: To help pupils achieve mastery of instructional objectives in reading and mathematics which they fail prior to instruction as measured by the Santa Clara Inventory of Developmental Tasks (Reading) and the BASE (Mathematics) criterion referenced tests.

Evaluation Objective #1: To determine if, as a result of participation in the program, 70 percent of the pupils master at least one instructional objective which prior to the program they did not master.

Subjects: All participants in the program.

Methods and Procedures: Pupils were assigned to classes on the basis of school records and teacher judgment. The Santa Clara was used as a leveler to determine instructional level, in the absence of standardized test data. Repeated failure on an item indicated a child's level. All participants were administered, as a pretest, selected criterion-referenced tests from the Santa Clara Inventory of Developmental Tasks (Reading) and the BASE (Math) Systems to ascertain individual instructional objectives for each pupil. For each instructional objective diagnosed as requiring remediation (as determined by pretest failure), a post-test was administered on an individual basis after an appropriate interval of instruction. For each instructional objective, results of passing and failing on both the pretest and the post-test should be recorded on the Class Evaluation Record (C.E.R.). */

Time Schedule The pretest was administered at the beginning of the program; the post-test at appropriate intervals throughout the life of the program.

Data Analysis: Data were analyzed and presented in tabular form ascertaining the percentage of participants demonstrating mastery or non-mastery of each instructional objective (according to SED classification system) at initial testing, and final testing.

*/ The terms pretest and post-test when used in the context of an evaluation based upon a criterion-referenced instrument are interchangeable with the terms entry test and mastery test.

Evaluation Objective #2: To determine, as a result of participation in the program, the extent to which pupils demonstrate mastery of instructional objectives.

Subjects: Same as above.

Methods and Procedures: Same as above.

Time Schedule: Same as above.

Data Analysis: Data were analyzed and presented in narrative and tabular form to ascertain each of the following. Tables are appended.

- A. The distribution of pupils failing to demonstrate mastery prior to instruction and not receiving sufficient instruction to receive the post-test.
- B. The distribution of pupils demonstrating mastery of objectives prior to instruction.
- C. The distribution of pupil mastery as a result of instruction by instructional objectives.
- D. The distribution of the number of objectives mastered as a result of instruction.
- E. The distribution of percentage of pupils achieving various levels of mastery of instructional objectives.

Evaluation Objective #3: To determine the extent to which the program, as actually carried out, coincided with the program as described in the Project Proposal.

Data Loss

The analysis excludes two pupils who attended only one half-day session. For the tally of children on Santa Clara developmental tasks, see the next paragraph.

Methodological Limitations

Developmental tasks under the Santa Clara are not readily mapped into the State-designated classification of reading and math activities. In some instances the Santa Clara developmental tasks (e.g., the ability to creep, walk, run) resemble no reading or math category in the State schema, and hence data on these tasks have been shown separately. In many instances, mapping was possible. Accordingly, the Santa Clara results are presented under the appropriate reading or math category.

For 80 children, all Santa Clara tasks have been completely remapped. The total for Santa Clara developmental tasks is reduced accordingly to 42.

Chapter III. FINDINGS

Objective #1: Did 70 percent of the pupils master at least one instructional objective during the program? Table "D" (appended) presents evidence in the affirmative. Fully 98% and 99% of the student body mastered one or more instructional objective during the program's course in reading and math respectively. Indeed the average child mastered approximately eight objectives in each area. In addition 34% of the student body (42 pupils) mastered one or more developmental tasks relevant to academic achievement during the program, at an average rate of three tasks per child. In short, learning was nearly universal, with many profoundly handicapped children mastering an impressive number of instructional objectives.

These results are not surprising. Observation shows the staff undertook instruction from the very beginning and continued in earnest throughout the program's duration. Also from observation, it can be reported that the program administration encouraged teachers to give children a sense of accomplishment by passing post-tests.

Objective #2: To what extent did pupils demonstrate mastery of instructional objectives as a result of participation in the program? Addressing this question with evidence beyond that already presented, we need to consider several issues:

- (a) to what extent did a demonstrated lack of mastery continue unchanged throughout the program?
- (b) to what extent did the program dwell on familiar territory on which pupils had already gained mastery?
- (c) to what extent were the gains in learning patterned by subject matter?
- and (d) to what extent were pupils likely to succeed in mastering the objectives they undertook?

Evidence on these issues follows.

(a) The extent of unattained objectives. Only 4% of the student body failed a reading item at the pretest and subsequently did not master the instructional objective by program's end. Similarly, in math, fully 97% of the pupils failing a pretest item subsequently mastered the instructional objective. Virtually all of the Santa Clara developmental tasks reported separately from the reading and math which were initially failed were later passed. Table "A" presents the details.

Several factors account for this widespread achievement. Teachers were encouraged to set instructional objectives realistically, in light of the children's capabilities and the summer's time constraints. Moreover special efforts were made by this hard-working dedicated staff to have each child accomplish his/her objective(s).

(b) The extent of fresh instructional objectives. Table "B" shows how often pupils demonstrated mastery prior to the program, expressed as a percentage of all pretest attempts. In both reading and math, nearly all students in the program failed at least three out of every four instructional objectives attempted. In reading, for example, 96% of the student body demonstrated mastery of instructional objectives prior to instruction 25% of the time or less. The comparable statistic for math is 97%. Only in the developmental tasks was there a higher rate of initial success: 73% of the students in the program successfully completed better than three out of four tasks prior to instruction.

The significantly better showing on the Santa Clara developmental tasks is due to classification of the more difficult developmental tasks under the appropriate reading or math activities, using the State-approved classification schema. This operation left the comparatively easier tasks (e.g., ability to run or hop) in the category of developmental tasks. As Table "B" shows, even these proved difficult for a number of pupils in this profoundly handicapped population.

In short, the summer's program was not a reiteration of previously mastered curriculum.

(c) Variability in learning by subject matter. Table "C" reinforces the interpretation placed on Table "A", viz. nearly universal achievement. On one instructional objective after another, all or nearly all youth who attempted the objective ultimately attained it. The most difficult objective, classification, foiled only 11% of the pupils attempting it.

(d) The likelihood of scholastic success. Table "E" shows the number of instructional objectives each child mastered as a percentage of all he (or she) undertook during the summer program. In both reading and math, a

very high proportion of the population (94% and 97% respectively) attained mastery 90-100% of the time. By contrast, only one program enrollee failed to master a single math or reading objective. Yet that same youngster did attempt and master four developmental tasks. In fact, as Table "E" shows, pupils in the program invariably accomplished the developmental tasks which had been set out for them. In short, the program spawned achievement, not pointless frustration, an interpretation corroborated by classroom observation.

Program Adequacy

The materials and facilities used by the program were adequate. The pupils and staff persisted admirably in the face of building renovation, which caused noise and grit as well as dislocated the program's administrative personnel.

On the basis of the evidence supplied above and on-the-scene observations, the program is servicing the needs of the specific target population for which it was designed. This is a crucial consideration in deciding whether to continue the program, since many parties -- the children's families included -- are limited in their ability to meet the special needs of this population.

Prior Recommendations

In evaluating the 1974 Summer Program, Dr. Merrill T. Hollinshead had recommended increasing staff for classes of deaf pupils with intellectual limitations. Implementing the suggestion, a class was established for retarded (CRMD) youngsters, staffed by a specialist in that field.

Objective #3: To what extent did the actual program coincide with the proposal design? There were no major departures from the program design. Several minor variations should be mentioned, however. Also difficulties

encountered in the implementation of the design are reported below.

The program design required the use of the results of a May, 1975 Title I city-wide test as a "leveler", i.e., as a basis for grouping children into instructional groups. Children at the School for the Deaf were not administered such a test. Hence classroom assignments were based on school records, teacher judgment, and the children's performance on the Santa Clara Inventory of Developmental Tasks. Repeated failure on a test item established a child's instructional level. This test usage registered substantial pupil "mastery" on developmental tasks initially. The frequency with which mastery was observed (Table B) reflects this use of the Santa Clara rather than a tendency on the part of the staff to reiterate curriculum.

The design structured partially incompatible requirements. The results of the Santa Clara are not always readily transcribed into the State-approved classification of reading and math activities. During the summer, teachers used two scoring schemas, recording their activities sometimes in terms of the Santa Clara recording schema and at other times in terms of the State-approved system. Where possible, activities recorded under the Santa Clara system have been reclassified by the evaluator to conform to the State classification schema. As this was not always possible, a residue of Santa Clara items have been reported in the tables and MIR Section III, Item 30.

The required heading in Table "A" ("Number of Instructional Objectives Failed") was amended by adding "Without Follow-Up". The statistic refers not to pretest failure alone, but to pretest failure with a post-test follow-up.

Finally several minor difficulties in test administration and data collection were encountered in the shift to a new type of test, i.e., criterion referenced testing. For one thing, the method of recording post-test results used by the program departed somewhat from the official Class Evaluation Record schema, in that no symbol was used to signify post-test or post-test failure. Thus an "E" on the program's records might reflect either no post-test or post-test failure. The effect of this recording error upon the data is to understate the apparent amount of instruction taking place during the summer in Table "A".

Some confusion resulted from the adoption of a new type of test. Teachers struggled with the tendency of criterion-referenced tests to direct the path of instruction, as opposed to adopting test-items that fit a preconceived course of instruction. Maintaining a new recording system on a daily basis throughout the program's duration constituted a sizeable clerical task, especially for teachers who individuate their instructional objectives. Finally, the evaluator did not participate in the initial orientation to the new tests and their administration. Consequently he was of minimal assistance to teachers and the program coordinator when questions about the initial guidance arose.

Many of these difficulties could be avoided by a careful review of testing materials and recording devices by the evaluator and program administrator in pre-program conferences before personnel training.

Chapter IV. SUMMARY OF MAJOR FINDINGS, CONCLUSIONS, AND RECOMMENDATIONS

Summary

The summer program serves a population which generally has few, if any, options for development-conducive activities during the summer. In seeking to advance this handicapped population's cognitive development, many more

than 70% (Objective #1) attained one instructional objective. Indeed, the average pupil attained nearly eight instructional items in reading and math each. In short, learning was widespread (Objective #2).

The program was instituted as written (Objective #3) with but minor exception. However the adoption of criterion-referenced testing complicated the program's implementation and evaluation.

Conclusion

The data give the clear impression that this program advances the cognitive growth of handicapped youngsters.

Recommendations

The program should definitely be continued. This recommendation is predicated on the demonstrated progress of students over the summer and on the basis of the lack of meaningful summertime options for deaf children. The costs of this program are small compared to the long-run costs that would be exacted by failure to develop deaf children into economically productive adults.

As for program evaluation, instruments should be selected in conjunction with the development of other program components. Where a new mode of testing is adopted, as in the present instance, the evaluator should participate in pre-program conferences and any workshops on test administration, so as to assist the program coordinator and other program personnel in the design and performance of their test-administration responsibilities.

22. Program Results: Please provide an abstract of your project, including results of the project which account for highly positive results. Provide a summary of the findings in relation to the objectives, as well as a description of the pedagogical methodology employed.

23. Date activities began 7 / 1 / 75 Date activities will terminate 8 / 8 / 75
Mo. D., Yr. Mo. D., Yr.

24. Project time span (check one): 1 ☐ School Year 2 ☒ Summer 3 ☐ 11 Mos. 4 ☐ More than 1 year

25. Project is: 1 ☐ New 2 ☒ Resubmitted 3 ☐ Continuation
(Title III only)

A. If project is resubmitted, please indicate number of years operated:

☐ 1 year ☐ 4 years
☐ 2 years ☒ 5 or more years

OFFICE OF EDUCATIONAL EVALUATION - DATA LOSS FORM
(attach to MIR, item #30) Function #09-61605

In this table enter all data loss information. Between MIR, item #30 and this form, all participants in each activity must be accounted for. The component and activity codes used in completion of item #30 should be used here so that the two tables match. See definitions below table for further instructions.

Component Code	Activity Code	(1) Group I.D.	(2) Test Used	(3) Total N	(4) Number Tested/ Analyzed	(5) Participants Not Tested/ Analyzed		(6) Reasons why students were not tested, or if tested, were not analyzed	Number/ Reason
						N	%		
6 0 8 1 1 7 2 0	pre-K	Santa Clara (74)	8	7	1	12		Attended only one session	1
6 0 8 1 3 7 2 0	1-3	"	52	51	1	2		Attended only one session	1
6 0 8 1 4 7 2 0	4-6	"	64	64	0	0			
6 0 9 1 1 7 2 0	Pre-K	Base	8	7	1	12		Attended only one session	1

6 0 9 1 4 7 2 0	4-6	"	64	64	0	0			

- (1) Identify the participants by specific grade level (e.g., grade 3, grade 9). Where several grades are combined, enter the last two digits of the component code.
- (2) Identify the test used and year of publication (MAT-70, SDAT-74, etc.).
- (3) Number of participants in the activity.
- (4) Number of participants included in the pre and posttest calculations found on item#30.
- (5) Number and percent of participants not tested and/or not analyzed on item#30.
- (6) Specify all reasons why students were not tested and/or analyzed. For each reason specified, provide a separate number count. If any further documentation is available, please attach to this form. If further space is needed to specify and explain data loss, attach additional pages to this form.
